

## **Bebit Inc. - Infrastructure Engineer**

### Job Description

You will be responsible for "USERGRAM", which is software that can grasp the psychology of users down to the latent level from detailed behavior of each user across PCs, smartphones, and applications, and can be used for marketing measures and business process construction. We want to change a service that is difficult for users to use due to individual optimization, but not overall optimization, into a user-centric service! The development of this product began with a strong desire to make it a reality.

With an intuitive UI/UX that is easy to use even for those who are not familiar with user analytics, more than 300 companies have implemented USERGRAM, and the number of user actions on USERGRAM has risen to nearly 1 billion per month. The number of installations has been steadily increasing and is expected to increase in the future.

In the future, we aim to capture not only access data to websites and apps but also data held by each company to clarify information about each user and create a situation where companies can empathize more with their users.

As the company expands into the global market, it is essential to build a scalable log aggregation system, enhanced monitoring tools, and a deployment and test environment that can withstand increased traffic.

### Responsibilities

- Experience in building large scale log aggregation systems.
- Experience in the implementation and management of metrics
- Experience with distributed stream processing
- Experience in operating ECS, k8s, etc.
- Experience in migrating from on-premises environments to the cloud
