

Bebit Inc. - Front-End Engineer

Job Description

USERGRAM" is a SaaS-type cloud service that specializes in capturing the "situation" of users. We are trying to measure user behavior data not only on various devices, but also on real behavior, and carefully visualize the order and flow of the data for each user. By enabling clients to intuitively understand user psychology, we aim to achieve business success as well as a comfortable society full of services and products that are filled with feelings for users.

As a company, it's called "Beavit" and has been in business for 20 years. Our philosophy, which has remained unchanged since our founding, is to contribute to the realization of an affluent society by creating truly useful products and services by exploring human psychology and behavioral characteristics, as well as the mechanisms that support them, and we have been mainly engaged in the consulting business.

The front end of USERGRAM is currently being developed by about 5 engineers, but due to further growth, there is still a lack of talent. We are looking for an engineer to develop the front end of USERGRAM with us!

Responsibilities

- Knowledge of all aspects of web system development from front-end to back-end and DB.
- Knowledge of usability
- Experience in SPA development using React.js or Vue.js.
- CSS design experience based on ECSS, SMACCS, etc.
- Development experience using HTML5 WebSocket.
- Design experience in Adobe XD
- Business level English
